## Reminders 10-13-10: <br> -Exam 2 Ch 4-6 Mon. Oct. 18

Objectives:
-Conservation of Momentum
Examples

- A big 4.0 kg fish moving to the left at $3.0 \mathrm{~m} / \mathrm{s}$ swallows a small 1.0 kg fish moving to the left at $2.0 \mathrm{~m} / \mathrm{s}$. What is the final speed of the big fish? What if the fish were moving in the opposite direction?

A gun with a muzzle velocity of $4.0 \times 10^{2} \mathrm{~m} / \mathrm{s}$ horizontally fires a 12 g bullet into a 2.0 kg block resting on a frictionless surface. The bullet comes to rest after traveling 15 cm .

- What are the impulse and change in momentum of each object just after the collision?
- What is the work done on the bullet by the block in bringing it to a complete stop?
- What is the force and average power required to stop the bullet?
- What is the average acceleration of the bullet?
- What is the work done on the block in this time.
